Database

SesRAG stores execution facts in PostgreSQL and vectors in pgvector.

Notification

Redis only provides notifications and short lived cache.

Local text

TXT and Markdown are parsed locally without MinerU.

Office

Office originals are sent to MinerU only after consent for each operation.

Publishing

A candidate index becomes active only after all stages succeed.

Failure

A failed rebuild preserves the previous active batch.

Snapshot

Each new Run freezes its retrieval view and model configuration.

Retry

An automatic retry keeps the same Run and user Message.

Worker

Every task write requires task id, worker id and generation.

Citation

Citations refer only to evidence selected into the actual context.

Rerank

Dense similarity and reranker relevance scores are recorded separately.

Neighbor

Neighbor expansion stays inside the same document and index batch.

Unknown

An unknown remote submission is not automatically submitted again.

Cancel

Local cancellation cannot guarantee remote cancellation or refund.

Limits

A source file must not exceed ten mebibytes.

Scope

One retrieval selects exactly one owned knowledge base.

Token

API credentials must never appear in public events or messages.

Events

Events use increasing sequence numbers within each Run.

Empty

An empty scope is a successful empty search, not a service failure.

Fallback

Office parser failures never fall back to a local parser.
